

# Big Data - Introduction

Winter Semester 2025/2026,

Cooperative State University Baden-Wuerttemberg

# Agenda – 29.09.2025

## 01 About This Lecture

Audience, Schedule, Materials (Slides, Script, Exercises, Books), Prerequisites, Exam, Feedback, Questions

## 02 Introduction To Big Data

Distributed Computing, Big Data V's, Big Data and Consistency, Big Data in Business, Definition of Big Data, Big Data Science

## 03 HandsOn - Hadoop

Quick Introduction To The Hadoop Ecosystem, HDFS, Yarn and MapReduce

## 04 HandsOn – Setup Google Cloud, Hadoop and MapReduce

Quick Introduction To Google Cloud, Create Own Hadoop Cluster with YARN and Run MapReduce Jobs on it

# About This Lecture

Scope, Schedule, Materials, Prerequisites, Exam,  
Feedback, Questions

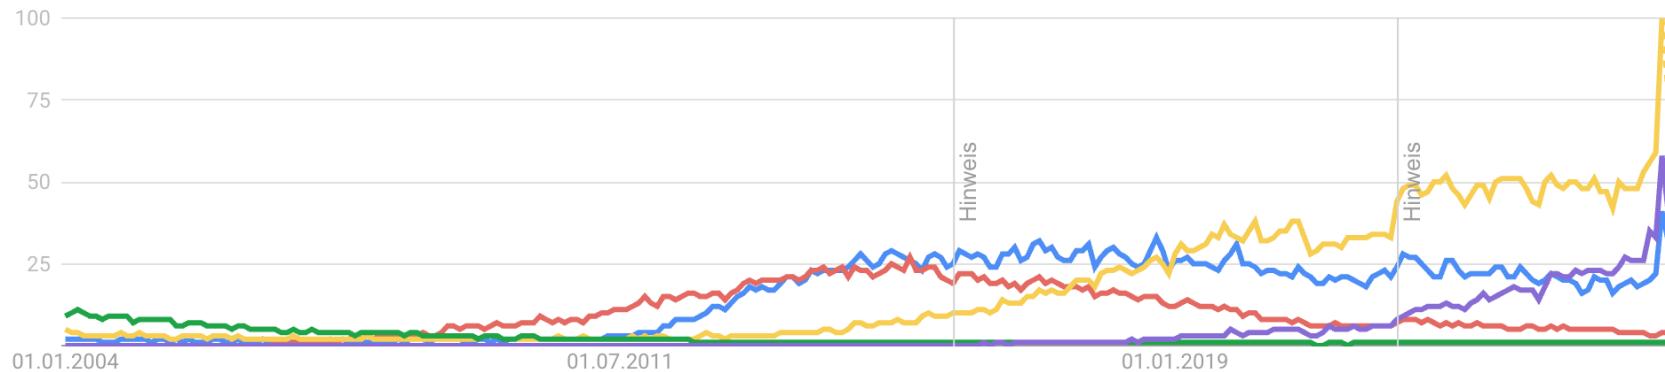

# About Big Data

***“Big Data is like teenage sex: everyone talks about it, nobody really knows how to do it, everyone thinks everyone else is doing it, so everyone claims they are doing it.”***

— Dan Ariely, Professor of Psychology and Behavioral Economics, Duke University

# About Big Data

● Big Data ● Hadoop ● Data Science ● Datawarehouse ● Databricks

Google Trends, 28.09.2025

# About This Lecture

- Sorting the **buzzwords** (Big Data, NoSQL, Scalability, Replication, Sharding...)
- Understand the **business value**
- Develop a basic understanding of **Big Data** and **Distributed Systems**:
  - How and why do they work?
  - Fundamental approaches (for e.g. Scaling, Distributed Storage, Distributed Processing, ...)
  - Data Models and Query Languages
  - Consistency guarantees of Distributed Big Data data-systems
  - Advantages and disadvantages of different software and approaches
  - Combination of different technologies

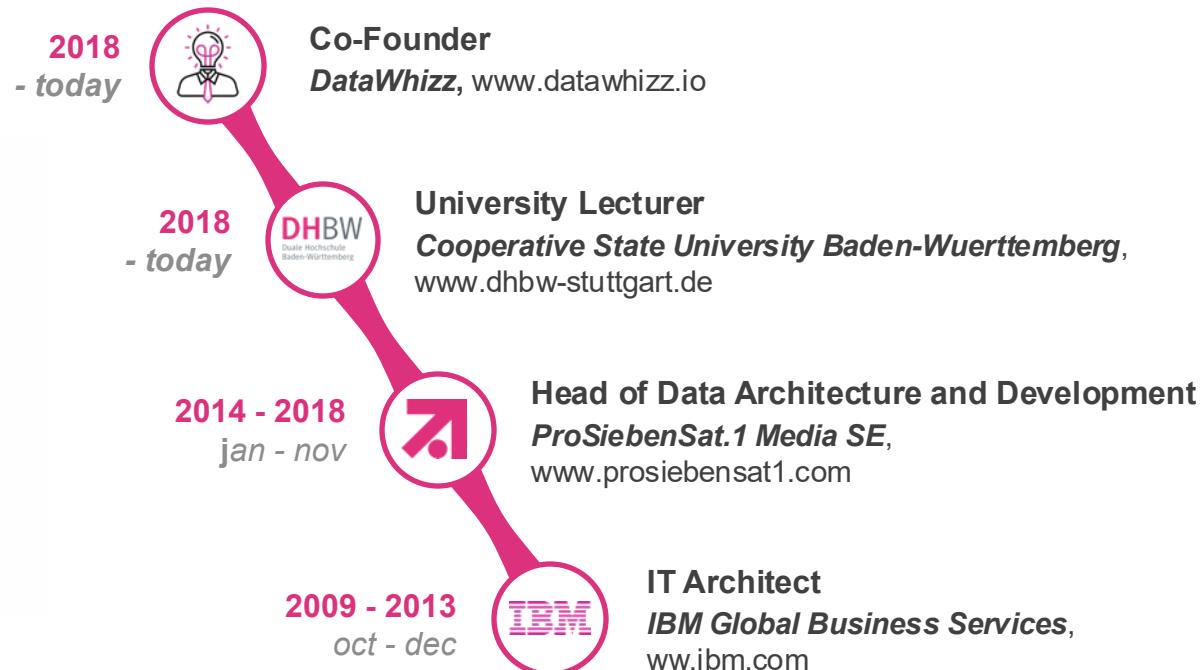

# About This Lecture

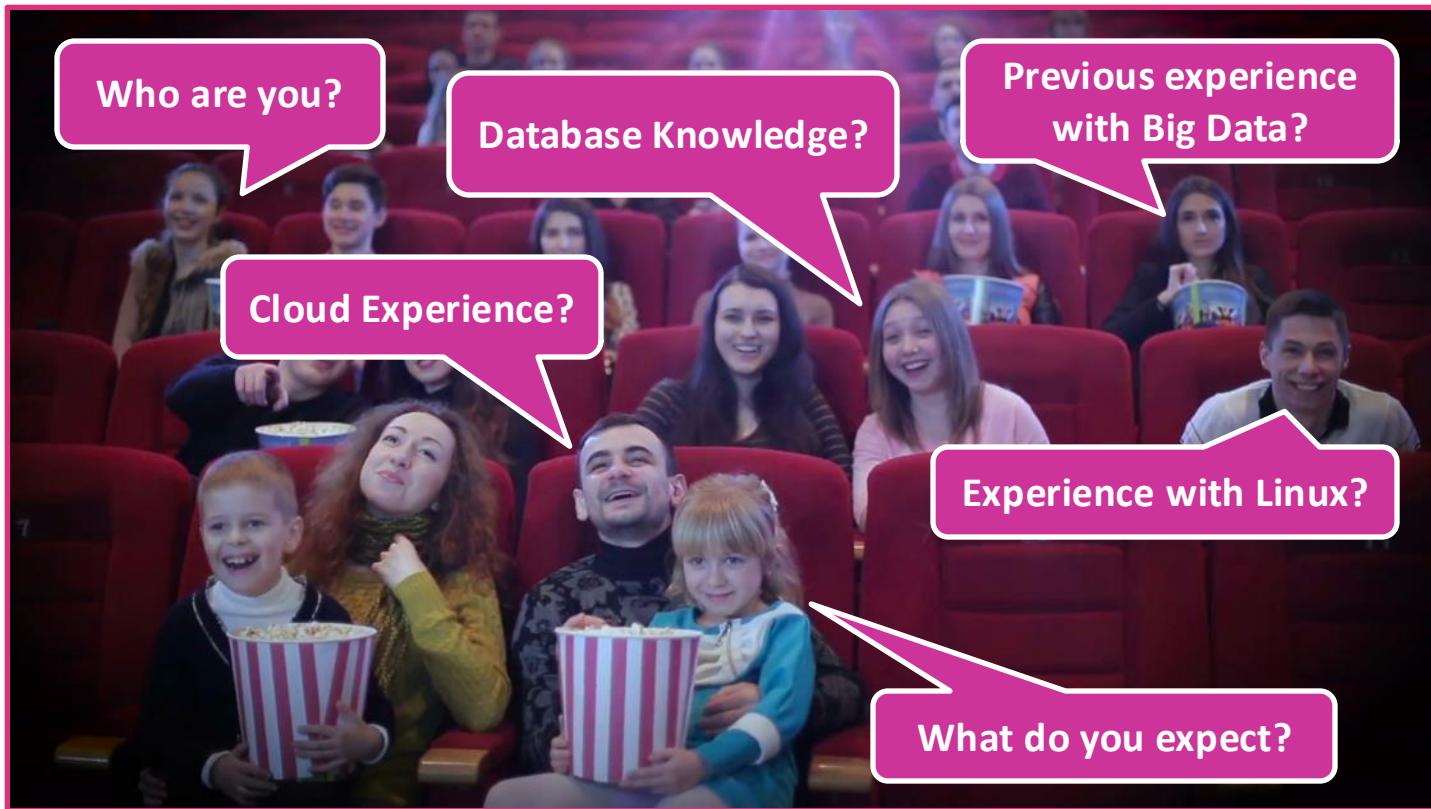

- **HandsOn Exercises** on several software and frameworks (e.g. Hadoop, Map-Reduce, Hive, Spark etc.)
- **How does a productive environment look like?** (e.g. Partitioning, Replication, ETL Workflow-Management etc.)
- Quick **introduction** to **data science**
- **Not in this Lecture:**
  - Database fundamentals (*previous lectures*)
  - ...

# About Me

# About You

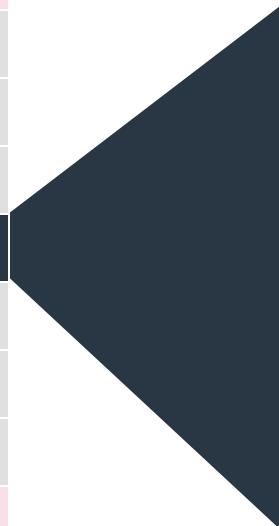

# Schedule

|                   |                    | <i>Lecture Topic</i> | <i>HandsOn</i>   |
|-------------------|--------------------|----------------------|--|
| <b>29.09.2025</b> | <b>13:15-15:45</b> | <b>Ro. N/A</b>       | <b>About This Lecture, Introduction to Big Data</b><br>Setup Google Cloud, Create Own Hadoop Cluster and Run MapReduce |
| 06.10.2025        | 13:15-15:45        | Ro. N/A              | (Non-)Functional Requirements Of Distributed Data-Systems, Data Models and Access<br>Hive and HiveQL                   |
| 13.10.2025        | 13:15-15:45        | Ro. N/A              | Challenges Of Distributed Data Systems: Partitioning<br>Data Partitioning (with HDFS/Hive, HiveServer2)                |
| 20.10.2025        | 13:15-15:45        | Ro. N/A              | Challenges Of Distributed Data Systems: Replication<br>Spark and Scala   |
| 27.10.2025        | 13:15-15:45        | Ro. N/A              | ETL Workflow and Automation<br>PySpark and Notebooks (Jupyter)   |
| 03.11.2025        | 13:15-15:45        | Ro. N/A              | Batch and Stream Processing<br>Airflow   |
| 10.11.2025        | 13:15-15:45        | Ro. N/A              | Practical Exam<br>Work On Practical Exam   |
| 17.11.2025        | 13:15-15:45        | Ro. N/A              | Practical Exam<br>Work On Practical Exam   |
| <b>24.11.2025</b> | <b>13:15-15:45</b> | <b>Ro. N/A</b>       | <b>Practical Exam Presentation</b>   |
| <b>01.12.2025</b> | <b>13:15-15:45</b> | <b>Ro. N/A</b>       | <b>Practical Exam Presentation</b>   |

# Schedule

|            |             |         |
|------------|-------------|---------|
| 29.09.2025 | 13:15-15:45 | Ro. N/A |
| 06.10.2025 | 13:15-15:45 | Ro. N/A |
| 13.10.2025 | 13:15-15:45 | Ro. N/A |
| 20.10.2025 | 13:15-15:45 | Ro. N/A |
| 27.10.2025 | 13:15-15:45 | Ro. N/A |
| 03.11.2025 | 13:15-15:45 | Ro. N/A |
| 10.11.2025 | 13:15-15:45 | Ro. N/A |
| 17.11.2025 | 13:15-15:45 | Ro. N/A |
| 24.11.2025 | 13:15-15:45 | Ro. N/A |
| 01.12.2025 | 13:15-15:45 | Ro. N/A |

1

**Presentation, Review and Discussion of exercises** from previous lecture

2

**Lecture** of current topic

3

**HandsOn** to Software&Frameworks

4

**Exercise execution**

# Prerequisites

## To efficiently participate:

- Background on and interest in **databases**
- **Basic knowledge** about and **HandsOn experience** with **Linux** (ideally Debian/Ubuntu)

## For exam:

- **Attendance on lectures**
- **Doing and completion of exercises**

# Feedback

Questions: **anytime**

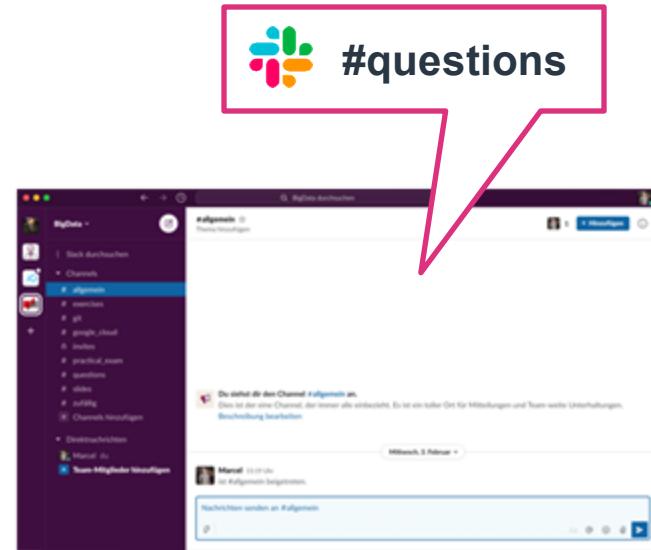

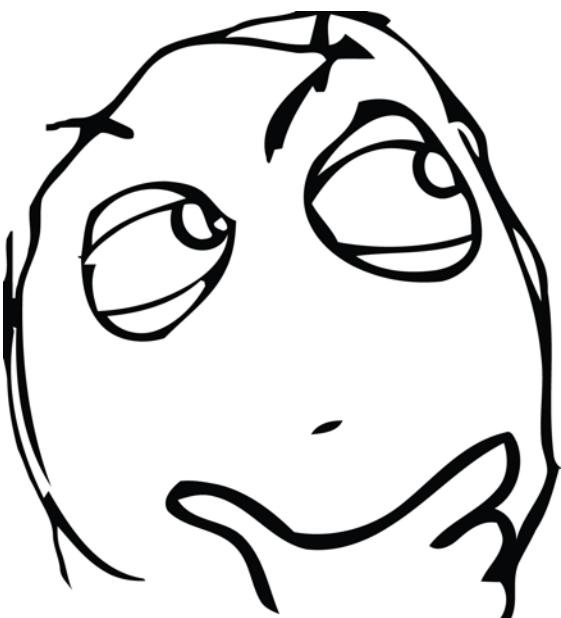

If you find any **mistakes** or **misspellings** in the script or slides:

- Mail: [contact@marcel-mittelstaedt.com](mailto:contact@marcel-mittelstaedt.com)
- commit a push request (git)

**Feedback** is welcome, via slack or mail

Please always **post questions** on **public slack channels**, so everybody can learn something ;)

# Questions

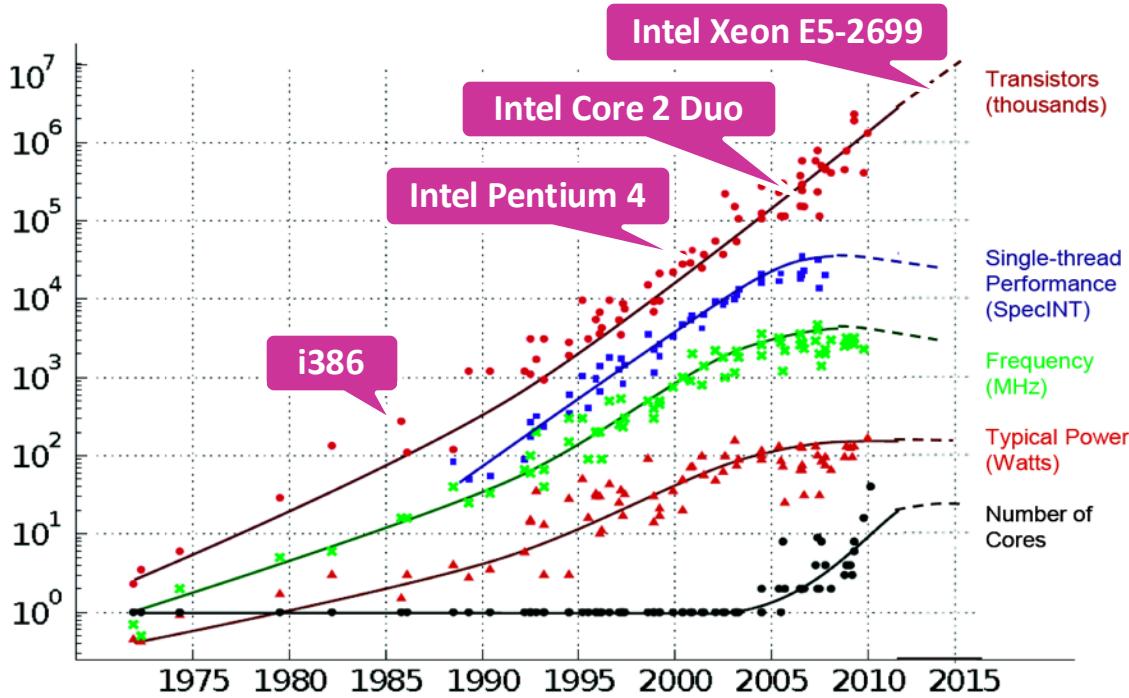

# Introduction To Big Data

Distributed Computing, Big Data V's, Big Data and Consistency, Big Data in Business, Definition of Big Data, Big Data Science

# Motivation - Paradigm Shift In Computing

## 35 YEARS OF MICROPROCESSOR TREND DATA

Original data collected and plotted by M. Horowitz, F. Labonte, O. Shacham, K. Olukotun, L. Hammond and C. Batten  
Dotted line extrapolations by C. Moore

- Frequency does not increase significantly anymore
- Watt does not increase anymore → **power wall** (temperature and power consumption)
- Transistor count still increases (**Moore's Law**)

## Paradigm Shift:

- **Back-In-Time:**  
→ **scale vertical** – optimize code for a **single thread**
- **Today:** **scale horizontal** – run code in **parallel**

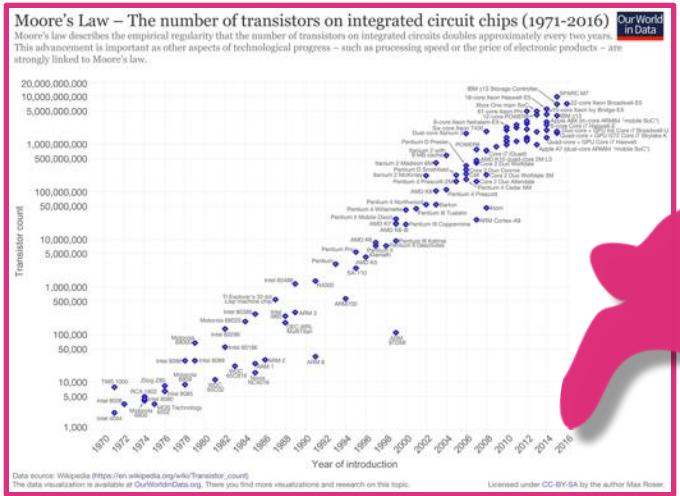

# Motivation – Definition Distributed Computing

*“Distributed computing is a field of computer science that studies distributed systems.*

*A distributed system is a system whose components are located on different networked computers, which then communicate and coordinate their tasks by passing messages to one other. The components interact with one other in order to achieve a common goal/task.”*

— [https://en.wikipedia.org/wiki/Distributed\\_computing](https://en.wikipedia.org/wiki/Distributed_computing)

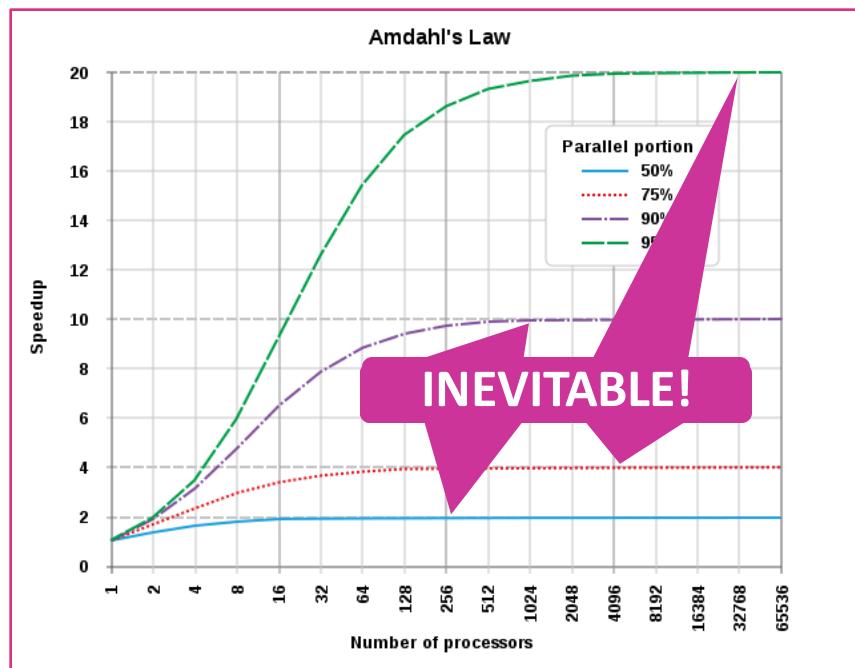

**Moore's Law:** is the observation that the number of transistors in a dense integrated circuit doubles about every two years.

**Distributed systems:** allow us to build data-systems with **any count of transistors**, just **by adding further nodes to a cluster**.

# Distributed Computing – Amdahl's Law

**Amdahl's Law:** *is a formula to predict the theoretical speed-up when using multiple processors for distributed/parallel computing. The speedup is limited by the sequential part of the program.*

**Formula:**

$$S_{\text{latency}}(s) = \frac{1}{(1 - p) + \frac{p}{s}}$$

**s** = #Cores/Degree of parallelization

$$\lim_{s \rightarrow \infty} S_{\text{latency}}(s) = \frac{1}{1 - p}$$

**p** = percentage of part of the code, which benefits from distributed/parallel execution

**Example Program:**

- takes **20 hours** on a **single core**
- **95%** of the code can be **executed in parallel**
- **8 cores** available

$$p = 0,95$$

$$s = 8$$

$$S_{\text{latency}}(s) = 1 / ((1 - 0,95) + (0,95 / 8)) = 5,9$$

$$\lim S_{\text{latency}}(s) = 1 / (1 - 0,95) = 20$$

→ execution time can **never** be **less than one hour**

# Distributed Technologies – Small Scale

**Size:** 0 - 10 Nodes

**Hardware:** “Commodity Hardware”

**Space:** < ~500 TB

**Cores:** < ~100 CPUs

**Costs:** cheap

**Low-Cost**  
e.g. *Raspberry Pi*

**Costs Per Node:**  
~30€

**Desktop PC's**  
e.g. anyone

**Costs Per Node:**  
~1.000-3.000€

# Distributed Technologies – Medium Scale

**Size:** 10 - 100 Nodes

**Hardware:** “Commodity Hardware” in terms of racks, usually with tuned parts (e.g. SAS instead of SATA drives, 8GBit Rack Uplink, 64-512GB RAM instead of 16-32GB etc.)

## Racks

e.g. HP ProLiant DL 380  
Gen 10, 2RU

## Costs Per Node:

~8.000-12.000€

**Space:** < ~7,2 PB

**Cores:** < ~1.600-3.200 CPUs

**Costs:** inexpensive (compared to **scale-up**)

## Desktop PC's

e.g. anyone

## Costs Per Node:

~1.000-3.000€

# Distributed Technologies – Large Scale

**Size:** 100 - X Nodes (e.g. 4.000 Nodes within Yahoo Hadoop Cluster in 2008)

**Hardware:** “Commodity Hardware” in terms of racks, usually with tuned parts (e.g. SAS instead of SATA drives, 8Gbit Rack Uplink, 64-512GB RAM instead of 16-32GB etc.)

**Space:** > ~10 PB

**Cores:** > ~3.200 CPUs

**Costs:** still rather cheap than pricey (compared to **scale-up**)

Yahooo Hadoop Cluster, 4.000 nodes, 2008

## Racks

40 Nodes / Rack

Rack Uplink 8Gbit

## Costs Per Node:

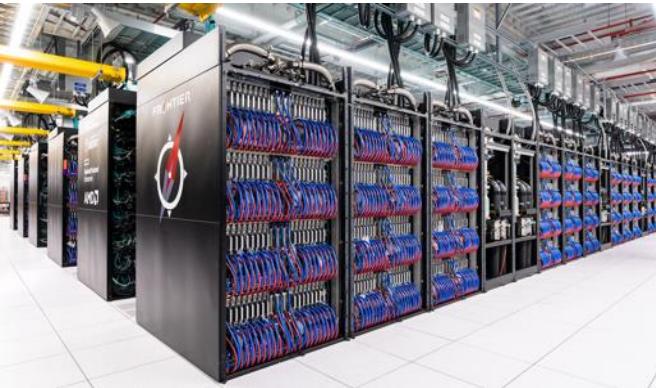

~8.000-15.000€

# Distributed Technologies – Supercomputer

| Name                     | Standort  | TeraFLOPS                                   | Konfiguration   | Energiebedarf | Zweck   |
|--------------------------|---|---|---|---------------|---|
| Frontier                 | Oak Ridge National Laboratory (Tennessee, USA)  | 1.100.000,00                                | 8,730.112 Processor: AMD Optimized 3rd Generation EPYC 64C 2GHz, 9 PB RAM   | 21.000 kW     | Wissenschaftliche Anwendungen   |
| Fugaku                   | RIKEN Center for Computational Science, Kobe, (Japan)   | 415.530,00                                  | 152.064 A64FX (48 Kerne, 2,2 GHz), 4,85 PB RAM  | 15.000 kW     | Wissenschaftliche Anwendungen   |
| Summit                   | Oak Ridge National Laboratory (Tennessee, USA)  | 122.300,00<br>aufgerüstet auf<br>148.600,00 | 9.216 POWER9 CPUs (22 Kerne, 3,1 GHz), 27,848 Nvidia Tesla V100 GPUs  | 10.096 kW     | Physikalische Berechnungen  |
| Sunway TaihuLight        | National Supercomputing Center, Wuxi, Jiangsu   | 93.014,60                                   | 40.960 Sunway SW26010 (260 Kerne, 1,45 GHz), 1,31 PB RAM, 40 Serverschränke mit jeweils 4 x 256 Nodes, insgesamt 10.649.600 Kerne           | 15.370 kW     | Wissenschaftliche und kommerzielle Anwendungen  |
| Sierra <sup>[8]</sup>    | Lawrence Livermore National Laboratory (Kalifornien, USA)   | 71.600,00                                   | IBM Power9 (22 Kerne, 3,1 GHz) 1,5 PB RAM   | 7.438 kW      | physikalische Berechnungen (z. B. Simulation von Kernwaffentests)                                 |
| Tianhe-2 <sup>[9]</sup>  | National University for Defense Technology, Changsha, China<br>finaler Standort: National Supercomputer Center (Guangzhou, Volksrepublik China) | 33.862,70<br>aufgerüstet auf<br>61.400,00   | 32.000 Intel Xeon E5-2692 CPUs (Ivy Bridge, 12 Kerne, 2,2 GHz) + 48.000 Intel Xeon Phi 31S1P Co-Prozessoren (57 Kerne, 1,1 GHz), 1,4 PB RAM | 17.808 kW     | Chemische und physikalische Berechnungen (z. B. Untersuchungen von Erdöl und Flugzeugentwicklung) |
| Hawk <sup>[10][11]</sup> | Höchstleistungsrechenzentrum Stuttgart (Deutschland)  | 26.000,00                                   | 11.264 AMD EPYC 7742(64 Kerne, 2,25 GHz), 1,44 PB RAM   | 3.500 kW      | Wissenschaftliche und kommerzielle Anwendungen  |
| Piz Daint                | Swiss National Supercomputing Centre (CSCS) (Schweiz)   | 21.230,00                                   | Cray XC50, Xeon E5-2690v3 12C 2,6 GHz, Aries interconnect, NVIDIA Tesla P100, Cray Inc. (361.760 Kerne)                                     | 2.384 kW      | wissenschaftliche und kommerzielle Anwendungen  |
| Titan                    | Oak Ridge National Laboratory (Tennessee, USA)  | 17.590,00                                   | Cray XK7, 18.686 AMD Opteron 6274 CPUs (16 Kerne, 2,20 GHz) + 18.688 Nvidia Tesla K20 GPGPUs, 693,5 TB RAM                                  | 8.209 kW      | Physikalische Berechnungen  |
| Sequoia <sup>[12]</sup>  | Lawrence Livermore National Laboratory (Kalifornien, USA)   | 17.173,20                                   | IBM BlueGene/Q, 98.304 Power BQC-Prozessoren (16 Kerne, 1,60 GHz), 1,6 PB RAM   | 7.890 kW      | Simulation von Kernwaffentests  |

**“Frontier”**,  
*Oak Ridge National Laboratory in Tennessee, USA*

**Racks: ~74++**  
**Nodes: 9.472**  
**Cores: ~8,7 Mio++**  
**TeraFLOPS: 1.100.000,00**  
**Energy: 21.000 kW**

*Frontier Supercomputer, Oak Ridge National Laboratory in Tennessee, USA*

<https://de.wikipedia.org/wiki/Supercomputer>

# Distributed Technologies – Large Cloud Cluster

**Size:** 200 Nodes

**Cores:** 12.800 vCPUs / 6.400 CPUs

\* **DISCLAIMER:** Completely ignoring storage, network, virtualization and sharing of CPUs etc.

## AWS:

**Instance:** m4.16xlarge

**vCPUs per Instance:** 64

**RAM per Instance:** 256

**Costs per hour per Instance:** 3,20 USD

**Costs for Large Cluster per hour:**

$200 * 3,20 \text{ USD} = 640,00 \text{ USD}$

Using **spot instances** this could be **less than ~100\$/hour**

<https://aws.amazon.com/de/ec2/pricing/on-demand/>

## Google Cloud:

**Instance:** n1.standard-64

**vCPUs per Instance:** 64

**RAM per Instance:** 240

**Costs per hour per Instance:** 3,04 USD

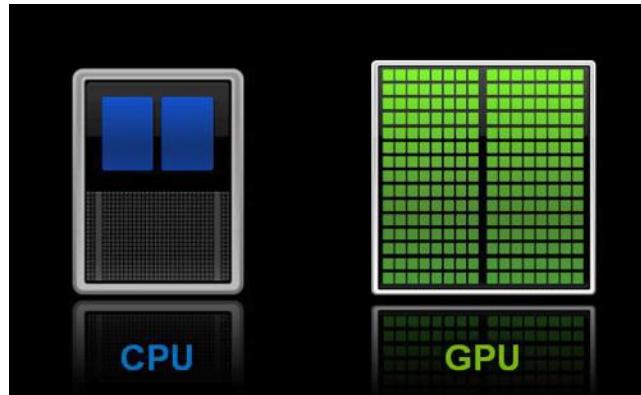

**Costs for Large Cluster per hour:**

$200 * 3,04 \text{ USD} = 608,00 \text{ USD}$

Using **spot instances** this could be **less than ~100\$/hour**

<https://cloud.google.com/compute/pricing>

# Distributed Technologies – GPU Computing

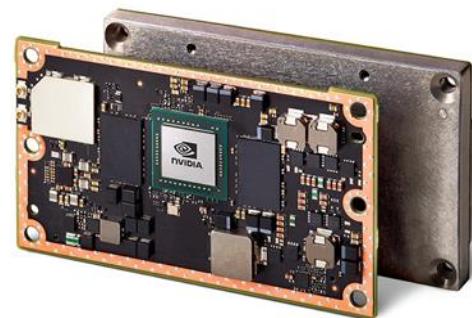

|               |  |   |
|---------------|--|---|
| <b>Cores:</b> | <b>2-18</b><br>(e.g. 12 Cores<br>for Intel Xeon E5-2690)       | <b>2.000-10.000</b><br>(e.g. 10.496 CUDA for<br>RTX 3090) |
| <b>Freq.:</b> | <b>2-4 Ghz</b><br>(e.g. 2,6-3,5 Ghz<br>for Intel Xeon E5-2690) | <b>1.000-2.000 MHz</b><br>(e.g. 1.70MHz<br>for RTX 3090)  |

- advanced GPUs **initially developed for**  
**(3D) gaming**

→ now also used for (distributable)  
**computational workloads** (e.g. Big Data,  
Machine Learning, **Crypto...**)

**Nvidia Jetson TX2**  
**Cores: 256 (CUDA)**  
**RAM per Instance: 8**

# Distributed Technologies – GPU Cluster

## On-Premise:

<https://cs.stanford.edu/csdcf/sail-compute-cluster>

<https://www.slideshare.net/papisdotio/introduction-to-multi-gpu-deep-learning-with-digits-2-mike-wang>

## Cloud:

### AWS:

#### Amazon EC2 Elastic GPUs – Preise

Mit Amazon EC2 Elastic GPUs zahlen Sie ausschließlich für die tatsächliche Nutzung. Die Preise für Elastic GPUs sind unten aufgeführt.

#### USA Ost (Ohio) und USA Ost (Nord Virginia)

| Größe der Elastic GPU | GPU-Arbeitsspeicher | Preis            |
|-----------------------|---------------------|------------------|
| eg1.medium            | 1 GiB               | 0,050 USD/Stunde |
| eg1.large             | 2 GiB               | 0,100 USD/Stunde |
| eg1.xlarge            | 4 GiB               | 0,200 USD/Stunde |
| eg1.2xlarge           | 8 GiB               | 0,400 USD/Stunde |

### Google Cloud:

#### GPU-Modelle für Compute Engine

| GPU-Modell          | Gpus   | GPU-Speicher | Verfügbare vCPUs   | Verfügbarer Speicher                                     |
|---------------------|--------|--------------|--|--|
| NVIDIA® Tesla® V100 | 1 GPU  | 16 GB HBM2   | 1–12 vCPUs   | 1–78 GB  |
|                     | 8 GPUs | 128 GB HBM2  | 1–96 vCPUs   | 1–624 GB   |
| NVIDIA® Tesla® P100 | 1 GPU  | 16 GB HBM2   | 1–16 vCPUs   | 1–104 GB   |
|                     | 2 GPUs | 32 GB HBM2   | 1–32 vCPUs   | 1–208 GB   |
|                     | 4 GPUs | 64 GB HBM2   | 1–64 vCPUs<br>(us-east1-c, europe-west1-d, europe-west1-b) | 1–208 GB<br>(us-east1-c, europe-west1-d, europe-west1-b) |
|                     |        |              | 1–96 vCPUs   | 1–624 GB   |

# Distributed Technologies – Big Data

## Distributed (Batch) Processing (Computing)

## Distributed (Stream) Processing (Computing)

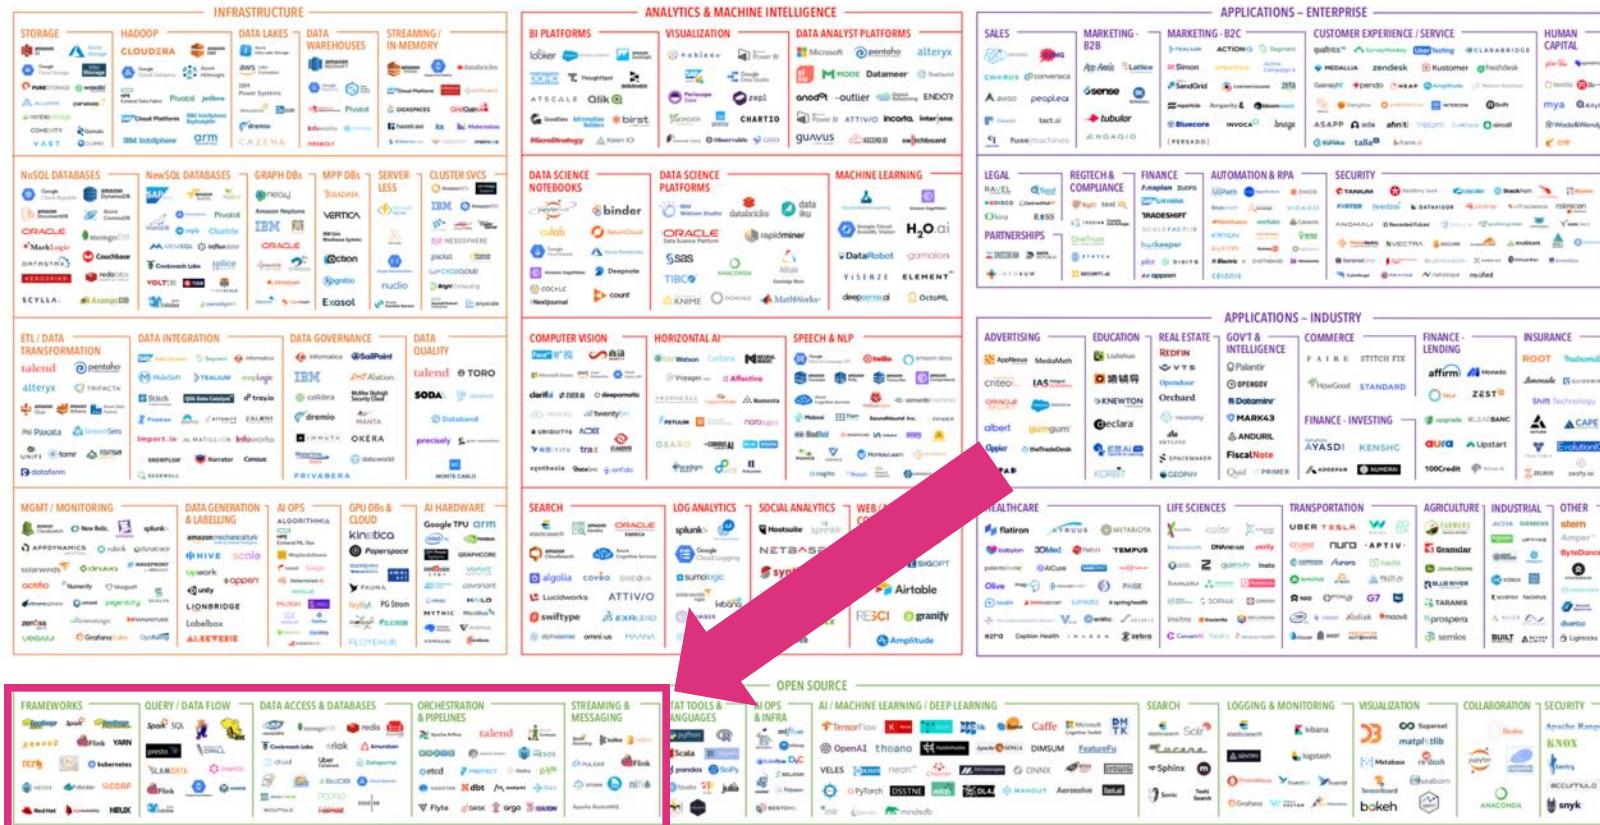

## Distributed DataStorage/Database Engines

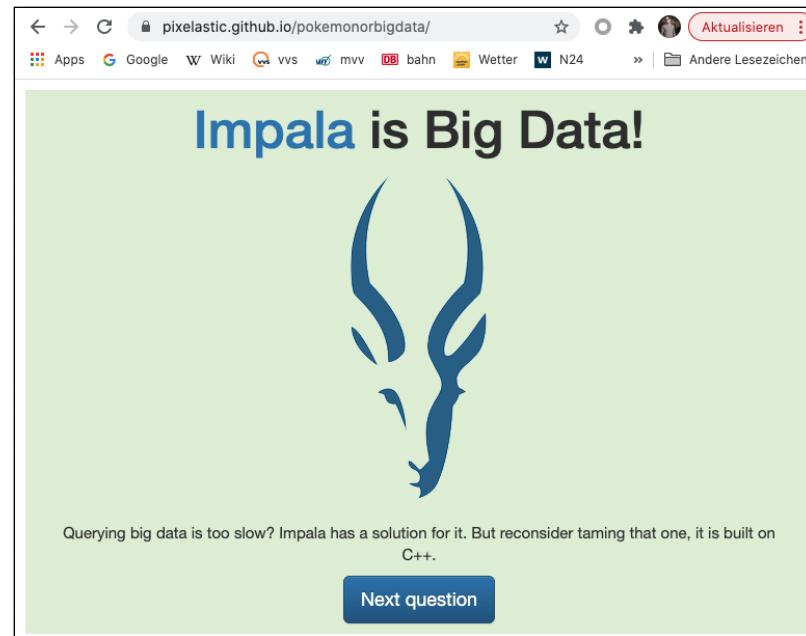

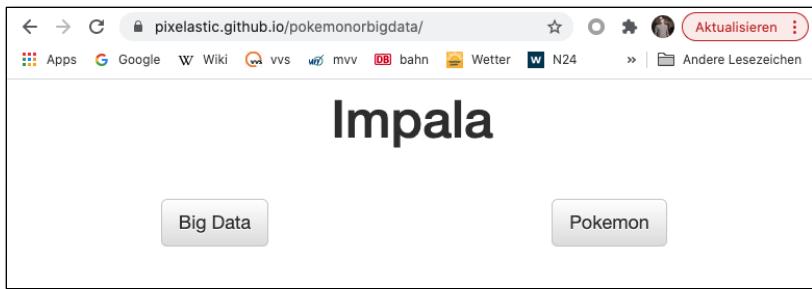

## Distributed Cloud Data Storages

# Pokemon or Big Data?

<https://pixelastic.github.io/pokemonorbigdata/>

# Big Data V's

- Introduced by **Gartner** in **2011**
- **Key-Characteristics** of Big Data
- **More V's** have established over time

# Big Data V's - Volume

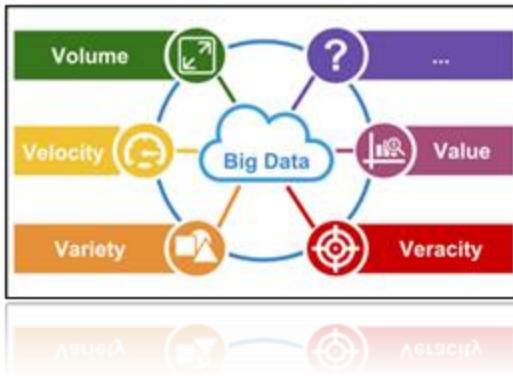

- **Wikipedia:** in 2014 the english part of Wikipedia and Wikipedia Commons had a size of around **23TB**
- **Spotify:** in 2013 data generated by users of spotify was about **1,5TB/day → 534TB/year**
- **Google:** search index size currently about **100PB**
- **Rule Of Thumb:** data that can easily be handled (e.g. processed, saved or queried) within a traditional database (e.g. PostgreSQL, Informix, DB2, Oracle etc.) and belonging datawarehouse, like a few gigabytes per week or month, is not Big Data.

# Big Data V's - Velocity

- **Facebook:** in 2012 **every 60 seconds:**  
**510.000** comments,  
**293.000** status updates and  
**136.000** photos  
had been posted on average.
- **Twitter:** in 2013 usually **500 million tweets** were posted each day on Twitter, which means **5.700 Tweets per second** on average.
- **Google:** According to Internet Live Stats, Google is handling around **6 billion search requests** per day right now, which means **70.000 per second**.

# Big Data V's - Variety

## Structured Data:

- plain data structures with **fixed attributes/columns**
- **specific data types** and **defined domain**
- related but different kinds of data records can easily be linked (primary/foreign keys)
- can easily (almost directly) be stored into a traditional relational database

## Semi-Structured Data:

- **do not** (easily) **fit** into the **constraints** of the **relational data model**
- possible (with additional effort) to transfer into relational world, but violating relational data model constraints
- no need to worry about *object-relational impedance mismatch*
- vulnerable to *garbage in – garbage out*

# Big Data V's - Variety

## Semi-Structured Data:

- **highly-nested** and **hierarchical** data structures
- Examples:
  - **JSON** documents (e.g. provided by the Facebook Graph API or the Twitter API)
  - **XML** documents (e.g. provided by the Google Maps Geocoding API or the OpenWeatherMap Weather API)
  - **HTML** documents, for instance if you're developing a web crawler (e.g. using Scrapy for data gathering or Selenium for testing purposes)

# Big Data V's - Variety

## Unstructured Data:

- everything that is **neither structured or semi-structured**
- Examples:

- **Natural Language:**

- Social Media Posts (e.g. Facebook and Twitter),
      - Ratings (e.g. on Amazon, IMDB or other platforms) or
      - plain text (e.g. Wikipedia articles, product information on Amazon or any e-commerce shop)
- you may want to analyze by *natural language processing* with the purpose of calculating a **sentiment** (*What do customers think about your product?*) or the meaning and truthfulness of a rating (*Is the review positive or negative? Is it fake?*).

# Big Data V's - Variety

## Unstructured Data:

- Examples:

- **Geographical Data:**

- GPS,
    - Radar,
    - sonar data or images

→ with the purpose of analyzing meteorological, vesicular or seismic behaviour, e.g. for the purpose of predicting the future.

- **Photos and Videos:**

→ for instance of traffic and surveillance cameras to analyze and optimize traffic flow or for the sake of security.

# Big Data V's - Variety

## Unstructured Data:

- Examples:

- **Scientific Data:**

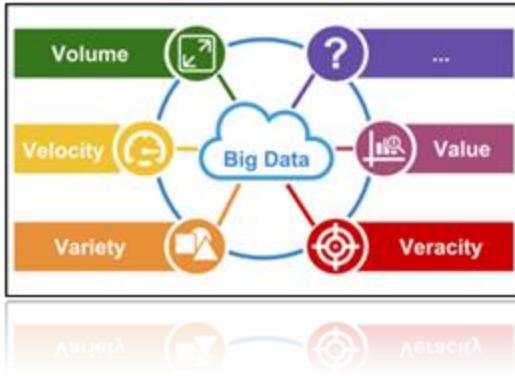

- physic measuring and sensor data,
    - seismic imagery or
    - atmospheric data

→ to analyze and optimize a physics experiment.

For instance CERN makes use of Hadoop for unstructured sensor data, to unlock insights from machine data.

# Big Data V's - Veracity

- **veracity** is about the **trustworthiness** and **accuracy** of a certain dataset, as data usually involves some uncertainty and ambiguities
- not just about the quality of the data itself, but also tasks of **quality assurance** and **data cleansing**, like removing **bias**, **superfluous**, **redundant** or just **duplicate records** or attributes.
- **trustworthiness** is highly vulnerable to the **volatility of the data** (which you usually cannot control), as a lot of data sources and related records frequently change in their lifetime
  - an account balance quickly changes over time (due to ongoing transactions)
  - people which have liked a topic, post or site on a social media platform may dislike it the next day

# Big Data V's - Veracity

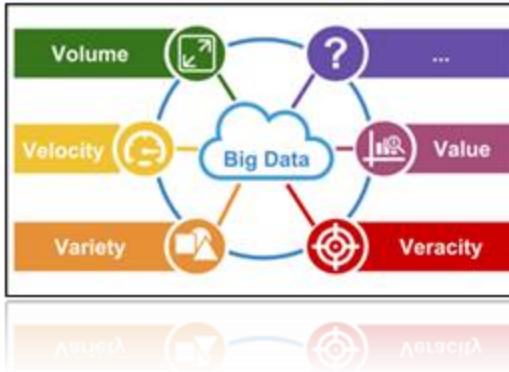

- even if you have a fully-fledged environment which **ensures data quality in its own limits**, you cannot be sure the data you are processing is 100% accurate, as there could already be a **mistake in the source system**
- Big Data data-system should always try to **achieve the best data quality possible**, even it is seen a lot: *Garbage In - Garbage Out* is not acceptable.

→ Garbage Data + Perfect ETL or Data Science Model = **Garbage Results**

→ Perfect Data + Messy ETL or Data Science Model = **Garbage Results**

# Big Data V's - Value

- **volume, velocity, variety and veracity** - all of them are meaningless if you dont derive **business value** from your data, but they are also significant **enabler** and **success factors** for the **value** of your data
- **value** can probably be found in any kind of data, but the challenge is to **pick the right data** (business case) and **use it the right way**
- **Volume and Value:** The more data you collect, the more insights you can probably gather and the more informed your insights and decisions may be.
- **Velocity and Value:** The faster data is collected and available for analysis processes, the faster it can be used for decision-making processes.

# Big Data V's - Value

- **Variety and Value:** The more data sources you connect to your data-system, the more insights you can potentially create.  
You will no longer rely on a single data source for a certain business object (like a client), which overall increases data quality and depth. Enabling you, for instance to build customer journeys, calculate a CLV, and in this way improve engagement and retention. At the end the value of your data increases.
- **Veracity and Value:** The more trustworthy and accurate your data is, more business critical decisions and applications will rely on it and in this way the revenue of your company will probably increase as well as the value of your data.

# Big Data V's – Other V's

- **Volatility:** How long data is valid and how long it should be stored. Retention requirements? Data Protection requirements?
- **Variability:** Format, schema or semantic changes.
- **Validity:** Like **veracity**, is the data correct and accurate for the intended use? Clearly valid data is key to making the right decisions.
- **Venue:** Different location require different access and work methods.
- ...

# Big Data Challenges – ACID

- Gives following **4 guarantees**:
  - **Atomic**: all operations in a transaction succeed or every operation is rolled back
  - **Consistent**: Before and after a transaction, the data-system is structurally sound.
  - **Isolated**: Transactions do not contend with one another. Contentious access to data is moderated by the database so that transactions appear to run sequentially.
  - **Durable**: The results of applying a transaction are permanent, even in the presence of failures.
- Ensures safe and reliable data storage and processing  
→ Requires a lot of additional workload like locks, moderated data access, failover protection

# Big Data Challenges – BASE

- Not (fully) ACID/ soft version of ACID

**Basic Availability:** the data-system should work and be available most of the time.

→ availability less than 100%

**Soft-State:** data stores do not have to be write-consistent, nor do different replicas have to be mutually consistent all the time.

→ Stored data may be inconsistent, but data store can derive consistent states.

**Eventual Consistency:** Stores exhibit consistency at some point later in time. For instance at read time.

→ usually consistent within seconds/milliseconds  
→ eventual consistency does not mean no-consistency

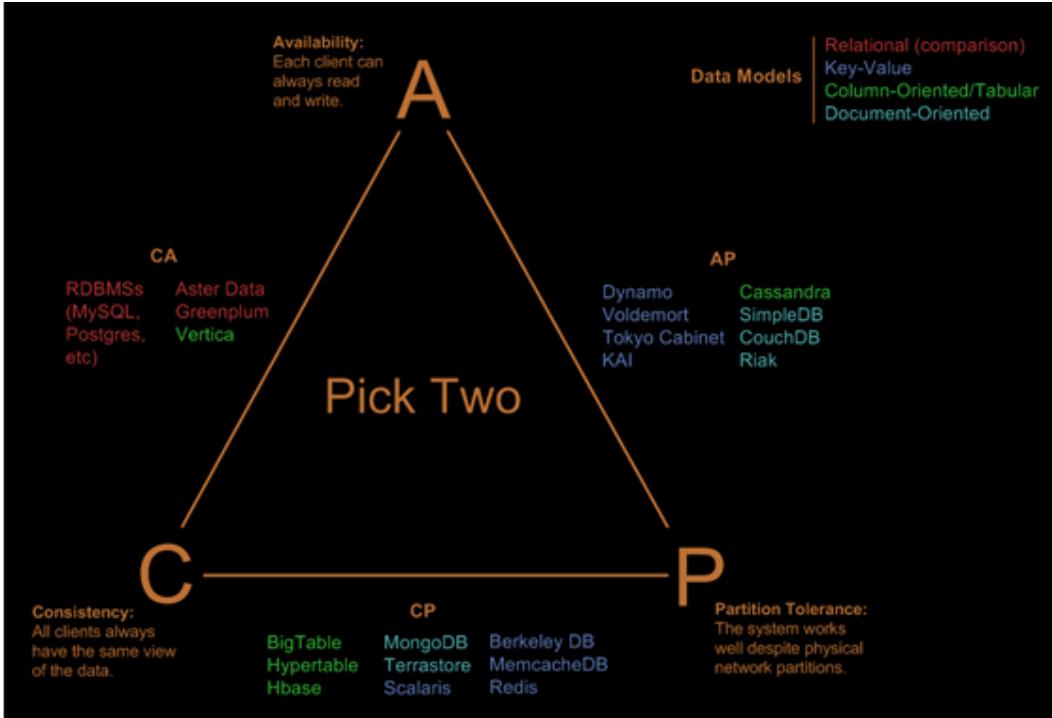

# Big Data Challenges – ACID vs BASE

| ACID                       | BASE                               |
|----------------------------|------------------------------------|
| Strong consistency         | Weak consistency                   |
| Isolation                  | Availability first/Last write wins |
| Focus on „commit“          | „Best effort“                      |
| Transactions               | Programmer managed                 |
| Nested transaction         | Approximate answer                 |
| Conservative (pessimistic) | Aggressive (optimistic)            |
| Robust database            | Simple database                    |
| Simple application code    | Complex application code           |

# Big Data Challenges – CAP (Eric Brewer)

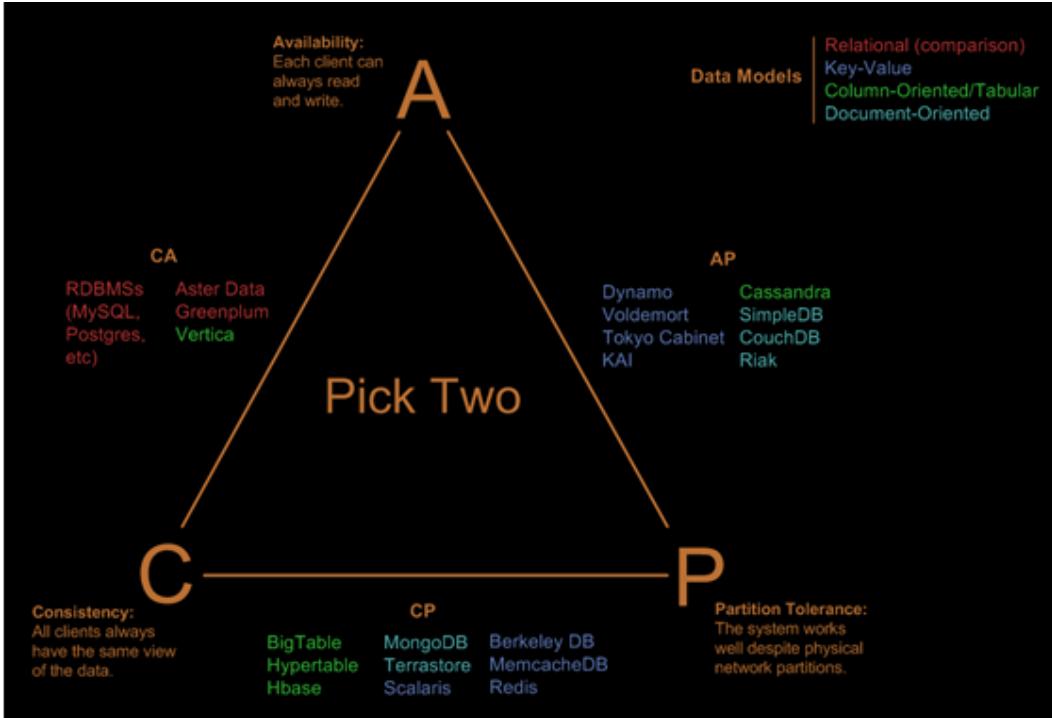

## - Availability:

**Every request receives a (*non-error*) response** - without guarantee that it contains the most recent write

- e.g. **high load**,
  - server **failures** or
  - query **congestion**
- may **deny service availability**

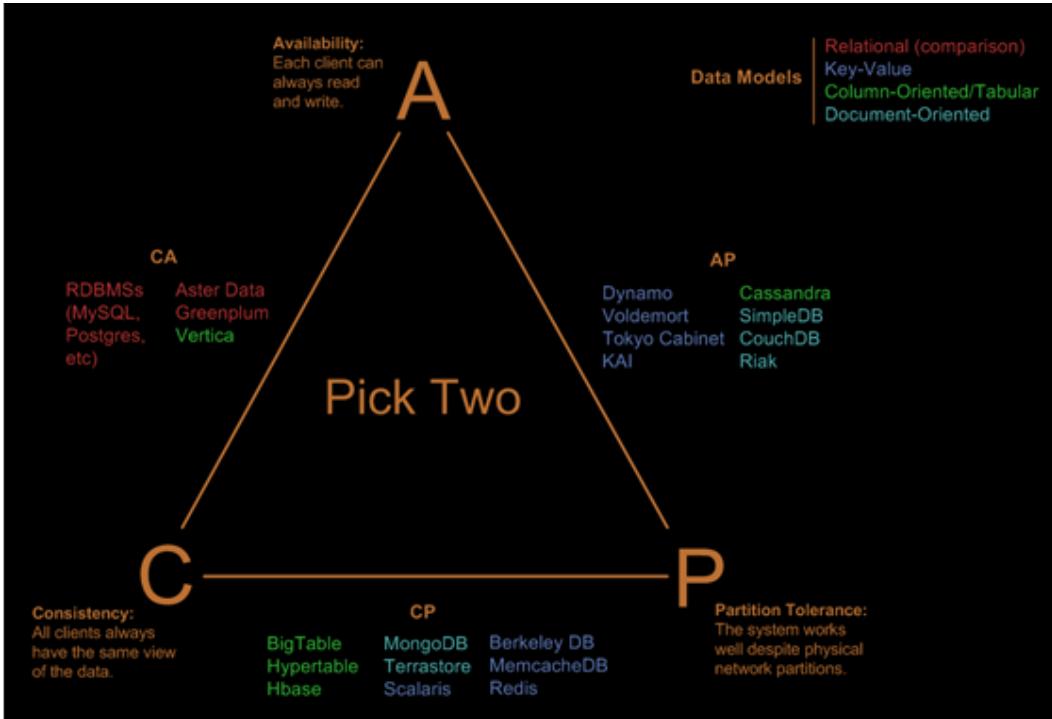

# Big Data Challenges - CAP

- **Consistency:** Every read/all clients receive the most recent write or an error.
- e.g. ***ACID consistency*** (consistent transactions)
- but on a **cluster-wide not node-wide** consistency

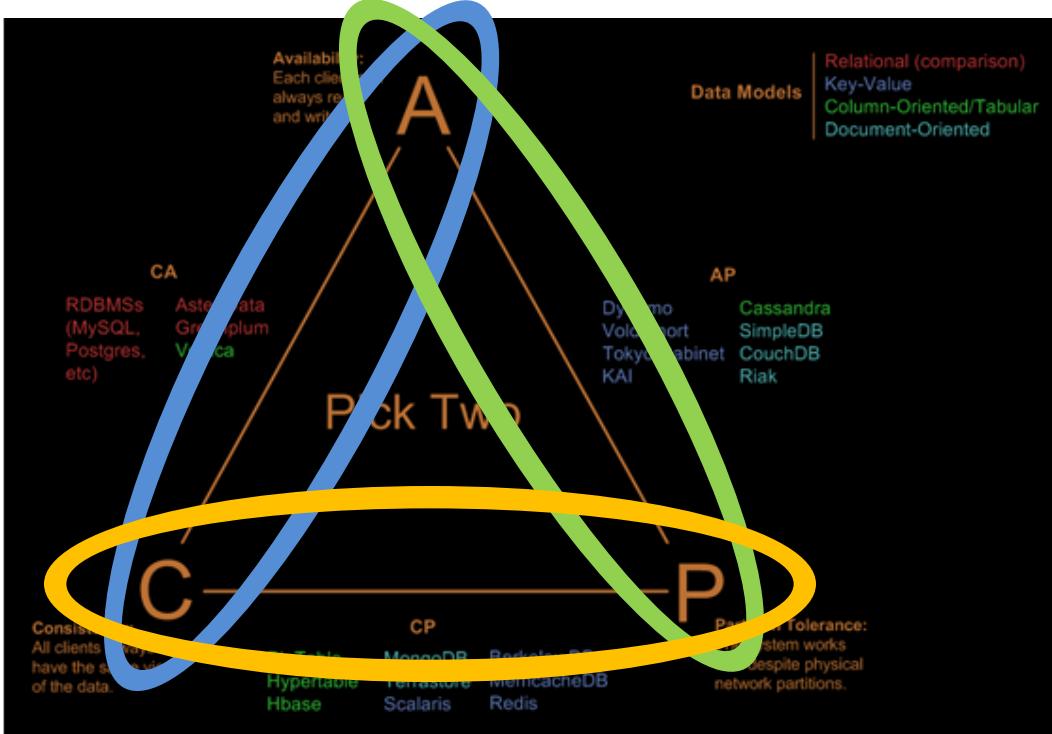

# Big Data Challenges - CAP

- **Partition Tolerance:** The **system continues to operate** despite an **arbitrary number of messages being dropped** (or delayed) by the network in between nodes.  
→ only total network failure might cause the data-system to respond incorrectly.

# Big Data Challenges – CAP Examples

- Usually achieved by **not sharing**.
- If **server or network failures** occur, return **whatever is possible**.
- If **server or network failures** occur, try to recover and **deny availability** until state is consistent again.
- **Traditional databases** usually achieve all 3 as they are not distributed.

# Big Data Roles - Data Engineer / Architect

|                                 |  |
|---------------------------------|--|
| <b>Study Direction:</b>         | Computer Science (databases, software engineering, distributed systems and processing, real-time/stream processing)  |
| <b>(Programming) Languages:</b> | Java, Scala, Python, Bash, if necessary ETL Tools<br>(e.g. Pentaho Data Integration, Informatica, DataStage, Talend)   |
| <b>Key-Skills:</b>              | <ul style="list-style-type: none"><li>– data modeling</li><li>– ETL and dataflow architecture and design</li><li>– data pipeline/workflow design and management</li><li>– stream- and batch-processing</li><li>– understand the concept, performance factors and limitations of distributed data-systems</li></ul> |

# Big Data Roles - Data Engineer / Architect

## Key-Skills:

- alignment with larger organizations goals and strategy as well as corporate guidelines (e.g. data protection, information security, license and toolset policies)

## Tasks:

- develop ETL jobs, data- and workflows
- develop and define architecture of a data-system,
- integration of data-sources
- alignment with larger organizations goals and strategy as well as corporate guidelines (e.g. data protection, information security, license and toolset policies)

# Big Data Roles - Data Infra/Cloud Ops

## **Study Direction:**

Computer Science (databases, software engineering, distributed systems and processing, real-time processing)

## **(Programming) Languages:**

Python, Bash, YAML (Terraform, CdK, Azure ARM, ...)

## **Key-Skills:**

- strong communication and collaboration skills
- broad knowledge of Ops Tools, best practices and automation
- frequently refreshes his knowledge about Ops tools continuously
  - Infrastructure Deployment Automation (Kubernetes, Docker, Salt, Ansible, Terraform, Puppet, Chef, ...)
  - Continuos Integration (e.g. Jenkins, Gitlab CI, AWS CodeBuild, AWS CodePipeline, Azure Devops, .), 

DATA  
INFRA  
CLOUD OPS

# Big Data Roles - Data Ops

## Key-Skills:

- Infrastructure Automation (e.g. Foreman, Puppet, Ansible),
- Containerization (e.g. Docker, LXD etc.),
- Orchestration (e.g. Kubernetes, Mesos, Swarm),
- Cloud (e.g. AWS, Google Cloud Platform, Azure, OpenStack)
- Source Control (e.g. Git, Bitbucket, SVN)

## Tasks:

- installs, configures, upgrades, scales and operates infrastructure and applications
- monitoring and management of infrastructure and applications
- provides and manages tools for continues delivery
- incident and problem management
- interface to developers (requirements for infrastructure, support developers needs and productive application operation)

# Big Data Roles - Data Scientist

**Study Direction:** Statistics, Data Science, Mathematics, Computer Science  
(Java, Python, R, SQL, Machine Learning)

**(Programming) Languages:** Python, Scikit, Numpy, Scipy, Pandas, R, Matlab, Bash, Java, Scala

**Key-Skills:**

- strong communication and collaboration skills
- business domain expertise
- deep understanding of the data he is working with
- broad experience in using programming languages and tools for statistical purposes (Python, R, SQL, MapReduce, Spark, SparkML, Pandas, dataframes)

# Big Data Roles - Data Scientist

## Key-Skills:

- knowledge of a variety of machine learning techniques (e.g. clustering, regression, decision trees, neural networks, properties of distribution)
- strong skills in data visualization (e.g. seaborn, Matplotlib, ggplot)

## Tasks:

- identify and evaluate data-analytics problems that offer the greatest opportunities and/or business value
- determining the right data sets and variables
- cleansing and validation of data to ensure completeness, accuracy and uniformity
- developing and applying models and algorithms on data
- analyze data to identify patterns, risks and trends
- communication with and visualization for (business) stakeholder

# Big Data Roles - Salaries

## Big Data Ops

→ €€€ ?

## Big Data Engineer

→ €€€ ?

## Data Scientist

→ €€€ ?

# Big Data Roles - Salaries

## Big Data Ops

50.000€ -  
80.000€

## Big Data Engineer

55.000€ -  
90.000€

## Data Scientist

60.000€ -  
100.000€

<https://www.glassdoor.de/Gehälter>

# Big Data Definition

*“**Big Data** is a term for **datasets** that are **too large**, **too fast** and/or **too complex** for traditional databases and **ETL tools** to handle.*

*The term **Big Data** also refers to all related **algorithms**, **software**, **infrastructure** and **tools** used to be able to cope with such datasets.”*

# Break

TIME FOR  
A  
BREAK

# Google Cloud Setup

Setup Google Cloud SDK, Setup SSH Access,  
Setup Firewall, Spawn Instances

# Setup gcloud SDK

## 1. Download and Install SDK:

Mac OSX:

```
# Download
wget https://dl.google.com/dl/cloudsdk/channels/rapid/downloads/google-cloud-cli-darwin-arm.tar.gz?hl=de

# Untar
tar -xvzf google-cloud-cli-403.0.0-darwin-x86_64.tar.gz -C ~/

# Install
~/google-cloud-sdk/install.sh
```

Windows:

```
https://dl.google.com/dl/cloudsdk/channels/rapid/GoogleCloudSDKInstaller.exe?hl=de
```

# Setup gcloud SDK

## 1. Download and Install SDK:

Linux:

```
# Add the Cloud SDK distribution URI as a package source
echo "deb [signed-by=/usr/share/keyrings/cloud.google.gpg] https://packages.cloud.google.com/
apt cloud-sdk main" | sudo tee -a /etc/apt/sources.list.d/google-cloud-sdk.list

# Import the Google Cloud Platform public key
curl https://packages.cloud.google.com/apt/doc/apt-key.gpg | sudo apt-key --keyring /usr/shar
e/keyrings/cloud.google.gpg add -

# Update the package list and install the Cloud SDK
sudo apt-get update && sudo apt-get install google-cloud-cli
```

# Setup gcloud SDK

## 2. Initialize SDK:

```
gcloud init
```

- Authenticate using your Google Cloud Account
- When asked for which cloud project to use: choose the one associated with the lecture Google Cloud Credits

# Setup SSH Access

1. If you do not already have SSH keys, create them:

```
ssh-keygen -t rsa -b 4096 -C "hans.wurst@lehre.dhbw-stuttgart.de"
```

2. Create **gcloud\_keys.txt** containing your public key (id\_rsa.pub) in this format:

```
hans.wurst:ssh-rsa AAAAB3NzaC1yc2EAAAQEA15EcXPTmrT2efonOKmr1yrNZtyEKmnWIOe4H9xbJp02Kus  
NRQTtdcWTpzDNKKCVxIYAfhaQ01dJaW8CZNJw8JaRnK8eLEHFg/+T86u2ep6BYLNDmjicnN8k3qZoCk4eAomCtqNo9O1/  
4TgFAo7a2Nk1LmoATPPUORoagbVCwZpU4e3emnSlyUkwkcjbMw24Fzwv4mkiebSGe58AsberhYtCaoGKRpjCtEMtCG0zb  
OxFc2Em4wYh9FQnLvKkdbEU1raPZ3aKIOpeDKjYLmp9r8D2akBvA31SgNRS/0uh7YhLw4kmicscTK1SETMG/TNZEP2smW  
fasG03LvMpC3vZ7w== hans.wurst@lehre.dhbw-stuttgart.de
```

3. Upload your SSH Key to Gcloud Metadata:

```
gcloud compute project-info add-metadata --metadata-from-file ssh-keys=gcloud_keys.txt
```

# Setup gcloud Firewall

## 1. Update Firewall Settings to be able to access services within gcloud:

```
gcloud compute firewall-rules create remoteaccess \
    --action=ALLOW \
    --rules tcp:80,tcp:8088,tcp:9870,tcp:10000,tcp:4040,tcp:8042,tcp:8888,tcp:9864,tcp:9000,tcp:9090,tcp:9091,
    tcp:9092,tcp:8080 \
    --description remote_access \
    --direction INGRESS \
    --network default \
    --source-ranges 141.31.0.0/17
```

Your IP (-Range)

- source\_ranges needs to be your public IP to limit accessibility of your future VM instances to you only:
  - **141.31.0.0/17** should be IP Range of DHBW Network
  - to get **your current public IP**: <http://ifconfig.me/> or:

```
curl ifconfig.me
141.31.42.37
```

# Spawn VM instance

## 1. Spawn VM Instance with 26GB RAM, 4 Cores and Ubuntu 20.04 LTS:

Put your Google project id here

```
gcloud compute --project=[your-project-id] instances create big-data \
    --zone=europe-west3-a \
    --machine-type=n2-highmem-4 \
    --subnet=default --network-tier=PREMIUM \
    --maintenance-policy=MIGRATE \
    --image=ubuntu-2004-focal-v20210129 \
    --image-project=ubuntu-os-cloud \
    --boot-disk-size=100GB \
    --boot-disk-type=pd-standard \
    --boot-disk-device-name=big-data
```

## 2. List all instances to get public IP of gcloud VM instance:

```
gcloud compute instances list
NAME      ZONE          MACHINE_TYPE   PREEMPTIBLE  INTERNAL_IP  EXTERNAL_IP     STATUS
big-data  europe-west3-a  n2-highmem-4           10.156.1.3  33.89.216.84  RUNNING
```

# Spawn VM instance

## 3. Connect To Your VM instance using SSH

Put your previously configured SSH user here (Slide 69)

```
ssh hans.wurst@33.89.216.84
```

Put EXTERNAL IP (from previous slide) here

```
Welcome to Ubuntu 20.04.2 LTS (GNU/Linux 5.4.0-1036-gcp x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

System information as of Sun Feb  7 17:39:54 UTC 2021

System load:  0.16           Processes:      140
Usage of /:   3.6% of 38.60GB  Users logged in:  0
Memory usage: 1%
Swap usage:   0%

1 update can be installed immediately.
0 of these updates are security updates.
To see these additional updates run: apt list --upgradable

The list of available updates is more than a week old.
To check for new updates run: sudo apt update

The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/*copyright.

Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.
```

# WELL DONE!

# Manage VM instances

## 1. Stop instance

```
gcloud compute instances stop big-data
```

## 2. Start instance

```
gcloud compute instances start big-data
```

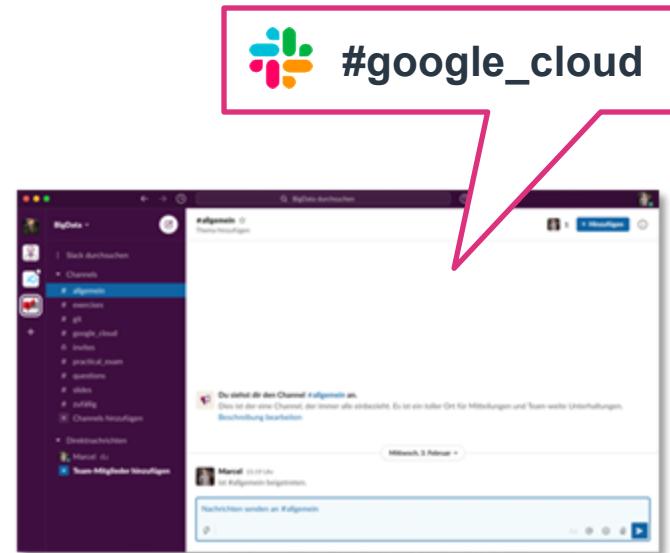

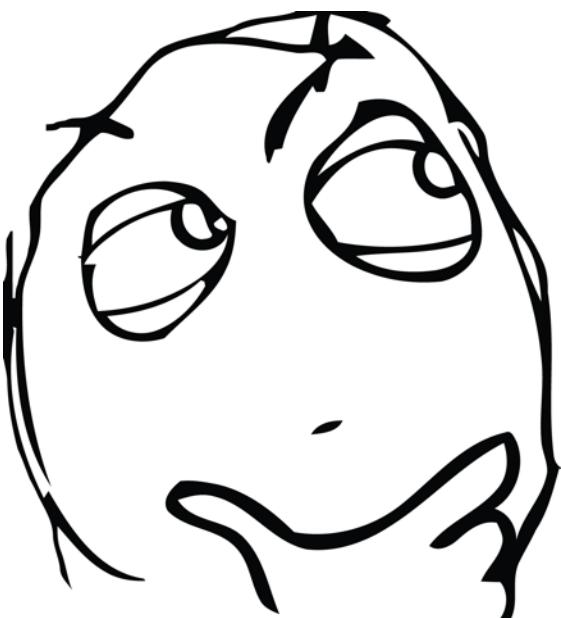

!!! ALWAYS REMEMBER TO **STOP YOUR INSTANCE** when **not used**,  
to do not waste gcloud credits!

Check if instance was successfully shut down:

```
gcloud compute instances list
NAME      ZONE          MACHINE_TYPE   PREEMPTIBLE  INTERNAL_IP  EXTERNAL_IP    STATUS
big-data  europe-west3-c  n2-standard-4           10.156.1.3          TERMINATED
```

# Questions

# Break

TIME FOR  
A  
BREAK

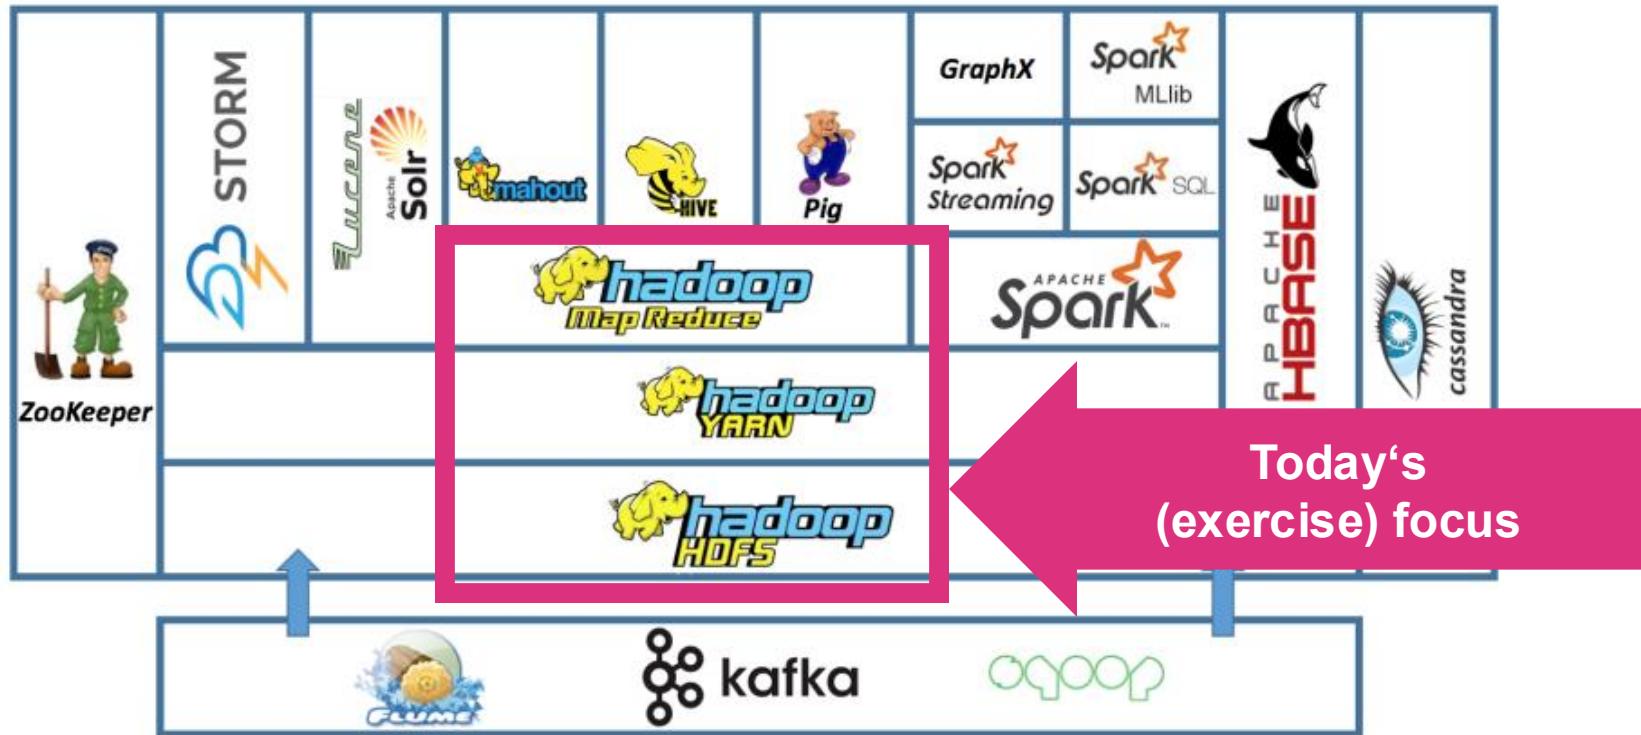

# HandsOn - Hadoop

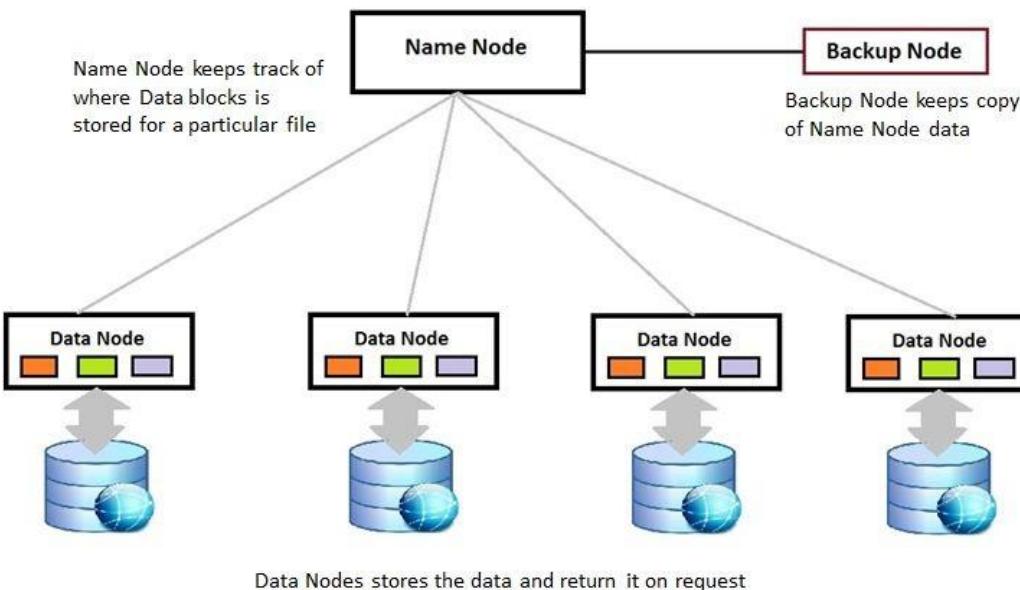

Quick Introduction To The Hadoop Ecosystem,  
HDFS, Yarn and MapReduce

# The Hadoop Ecosystem

# The HDFS

- **Hadoop Distributed Filesystem**
- Highly available and distributed filesystem
- Can easily be scaled to a cluster of hundreds or even thousands of nodes and in this way **Petabytes of data**

# Cloud-based distributed Filesystems

Managed Clusters

AWS EMR

Managed Filesystems

AWS S3

Databricks

Azure DataLake

Dataproc

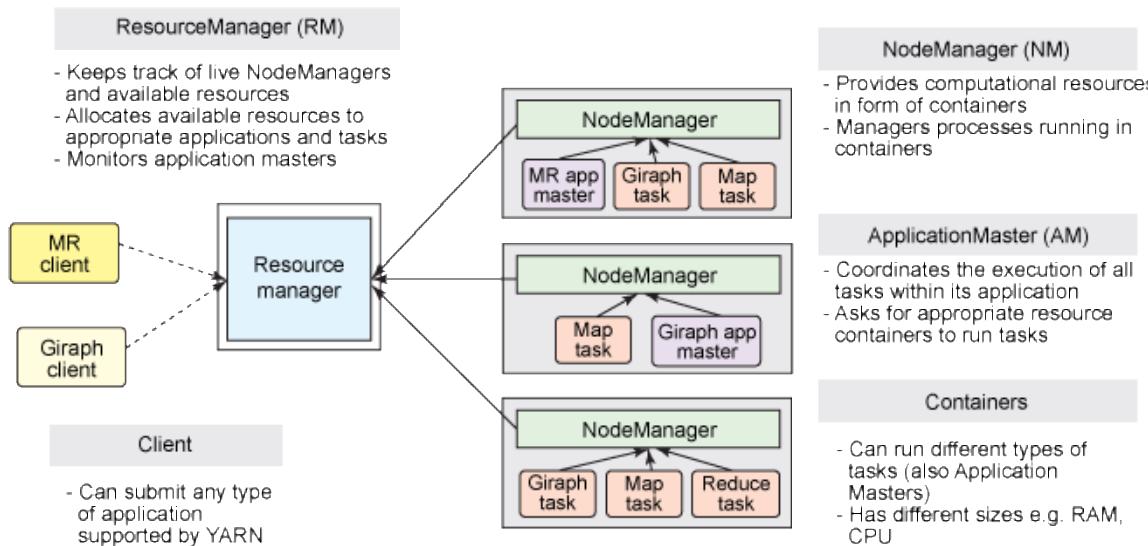

Google Buckets

- *HDFS is usually used when using on-premise Hadoop Clusters*
- *In the Cloud you can also run and manage your own Hadoop cluster manually e.g. with Kubernetes*
- *But lot of people use **managed clusters** like:*
  - AWS EMR,
  - Databricks on Azure/AWS/GCloud
  - Google DataProc
  - ...
- *and then use cloud based **managed distributed filesystems instead of HDFS**, e.g.:*
  - AWS S3 Bucket Storage
  - Microsoft Azure Data Lake Gen2 Storage
  - Google Cloud Buckets

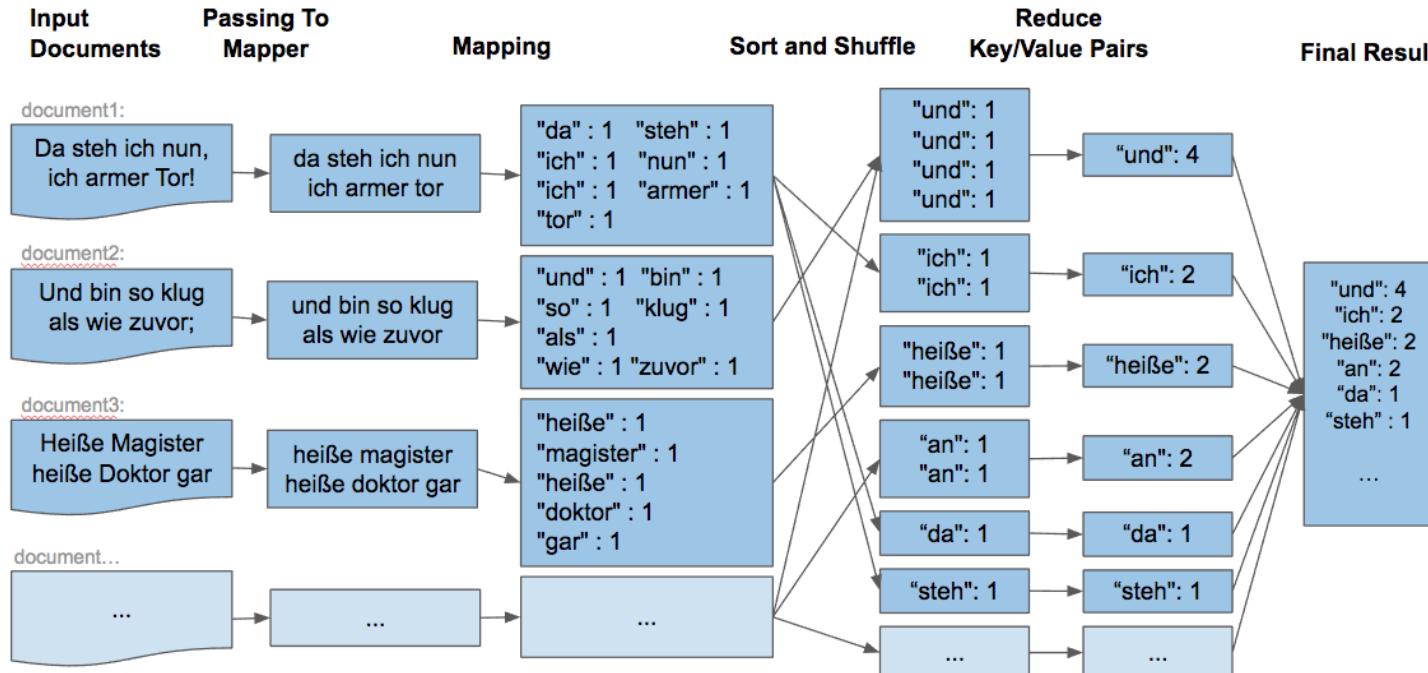

# YARN

- Yet another Ressource Negotiator
- Hadoop Ressource Manager (e.g. CPU, Memory, Job Scheduling, Preparation, Execution and Priorization)

# MapReduce

- Programming paradigm for processing large datasets in parallel on a distributed cluster

# Exercises Preparation

Setup Hadoop, HDFS and Yarn manually  
(standalone)

# Install and Setup Java

## 1. Install OpenJDK (JDK 8):

```
sudo apt-get update  
sudo apt-get install openjdk-8-jdk
```

## 2. Verify installation:

```
java -version  
  
openjdk version "1.8.0_292"  
OpenJDK Runtime Environment (build 1.8.0_292-8u292-b10-0ubuntu1~20.04-b10)  
OpenJDK 64-Bit Server VM (build 25.292-b10, mixed mode)
```

## 2. SET JAVA\_HOME and JRE\_HOME:

```
sudo vi /etc/environment
```

```
JAVA_HOME="/usr/lib/jvm/java-8-openjdk-amd64"  
JRE_HOME="/usr/lib/jvm/java-8-openjdk-amd64/jre"
```

# Setup Hadoop User

## 1. Create User:

```
sudo adduser --disabled-password --gecos "" hadoop
```

## 2. Switch To User:

```
sudo su hadoop
```

## 3. Switch Back To Root user:

```
exit
```

# Setup SSH (needed by Hadoop components)

## 1. Install SSH and PDSH:

```
sudo apt-get install ssh pdsh
```

## 2. Create Private/Public Keypair for hadoop user (*without passphrase*):

```
sudo su hadoop
cd
ssh-keygen -t rsa -N "" -f /home/hadoop/.ssh/id_rsa
```

## 3. Add Public Key To Authorized Keys file (to enable passwordless ssh login)

```
cat /home/hadoop/.ssh/id_rsa.pub >> /home/hadoop/.ssh/authorized_keys
chmod 0600 /home/hadoop/.ssh/authorized_keys
```

# Setup SSH (needed by Hadoop components)

## 4. Check If SSH Is Working

```
hadoop@big-data:~$ ssh localhost
The authenticity of host 'localhost (127.0.0.1)' can't be established.
ECDSA key fingerprint is SHA256:YEUFliBVczkz2rvKWNyU9hB2ix2jnhBqLlbsJQfuBpE .
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added 'localhost' (ECDSA) to the list of known hosts.

# Install Hadoop

## 1. Download Hadoop (v3.1.1):

```
wget https://archive.apache.org/dist/hadoop/common/hadoop-3.1.2/hadoop-3.1.2.tar.gz
```

## 2. Extract Binaries:

```
tar -xvzf hadoop-3.1.2.tar.gz
```

## 3. Move Binaries:

```
mv hadoop-3.1.2 hadoop
```

# Configure Hadoop

## 1. Set Up **UNIX** Environment Variables

```
vi .bashrc
```

```
export HADOOP_HOME=/home/hadoop/hadoop
export HADOOP_INSTALL=$HADOOP_HOME
export HADOOP_MAPRED_HOME=$HADOOP_HOME
export HADOOP_COMMON_HOME=$HADOOP_HOME
export HADOOP_HDFS_HOME=$HADOOP_HOME
export YARN_HOME=$HADOOP_HOME
export HADOOP_COMMON_LIB_NATIVE_DIR=$HADOOP_HOME/lib/native
export PATH=$PATH:$HADOOP_HOME/sbin:$HADOOP_HOME/bin
export PDSH_RCMD_TYPE=ssh
```

```
source .bashrc
```

# Configure Hadoop

## 2. Add **Hadoop** Environment Variables (*hadoop-env.sh*)

```
vi /home/hadoop/hadoop/etc/hadoop/hadoop-env.sh
```

```
export JAVA_HOME=/usr/lib/jvm/java-8-openjdk-amd64
```

# Configure Hadoop

## 3. Set Up **CORE** Variables (*core-site.xml*)

```
vi /home/hadoop/hadoop/etc/hadoop/core-site.xml
```

```
<configuration>
  <property>
    <name>fs.default.name</name>
    <value>hdfs://localhost:9000</value>
  </property>
</configuration>
```

# Configure Hadoop

## 4. Set Up **HDFS** Variables (*hdfs-site.xml*)

```
vi /home/hadoop/hadoop/etc/hadoop/hdfs-site.xml
```

```
<configuration>
    <property>
        <name>dfs.replication</name>
        <value>1</value>
    </property>

    <property>
        <name>dfs.name.dir</name>
        <value>file:///home/hadoop/hadoopdata/hdfs/namenode</value>
    </property>

    <property>
        <name>dfs.data.dir</name>
        <value>file:///home/hadoop/hadoopdata/hdfs/datanode</value>
    </property>
</configuration>
```

# Configure Hadoop

## 5. Set Up **MapReduce** Variables (*mapred-site.xml*)

```
vi /home/hadoop/hadoop/etc/hadoop/mapred-site.xml
```

```
<configuration>
  <property>
    <name>mapreduce.framework.name</name>
    <value>yarn</value>
  </property>
  <property>
    <name>yarn.app.mapreduce.am.env</name>
    <value>HADOOP_MAPRED_HOME=${HADOOP_HOME}</value>
  </property>
  <property>
    <name>mapreduce.map.env</name>
    <value>HADOOP_MAPRED_HOME=${HADOOP_HOME}</value>
  </property>
  <property>
    <name>mapreduce.reduce.env</name>
    <value>HADOOP_MAPRED_HOME=${HADOOP_HOME}</value>
  </property>
</configuration>
```

# Configure Hadoop

## 6. Set Up **YARN** Variables (*yarn-site.xml*)

```
vi /home/hadoop/hadoop/etc/hadoop/yarn-site.xml
```

```
<configuration>
    <property>
        <name>yarn.nodemanager.aux-services</name>
        <value>mapreduce_shuffle</value>
    </property>
    <property>
        <name>yarn.nodemanager.resource.memory-mb</name>
        <value>16384</value>
    </property>
</configuration>
```

# Configure Hadoop

## 7. Clear HDFS

```
hdfs namenode -format
```

## 8. Start HDFS:

```
start-dfs.sh
```

## 9. Start YARN:

```
start-yarn.sh
```

# Check Hadoop/HDFS

## 10. Run Admin Status Report

```
hdfs dfsadmin -report
```

```

# Check Hadoop/HDFS

11. Check Ressource Manager Landing Page (<http://XXX.XXX.XXX.XXX:8088/cluster>):

The screenshot shows the Apache Hadoop Resource Manager landing page at <http://34.107.1.48:8088/cluster/nodes>. The page title is "Nodes of the cluster".

**Cluster Metrics:**

| Apps Submitted | Apps Pending | Apps Running | Apps Completed | Containers Running | Memory Used | Memory Total | Memory Reserved | VCores Used | VCores Total | VCores Reserved |
|----------------|--------------|--------------|----------------|--------------------|-------------|--------------|-----------------|-------------|--------------|-----------------|
| 0              | 0            | 0            | 0              | 0                  | 0 B         | 16 GB        | 0 B             | 0           | 8            | 0               |

**Cluster Nodes Metrics:**

| Active Nodes | Decommissioning Nodes | Decommissioned Nodes | Lost Nodes | Unhealthy Nodes | Rebooted Nodes | Shutdown Nodes |
|--------------|-----------------------|----------------------|------------|-----------------|----------------|----------------|
| 1            | 0                     | 0                    | 0          | 0               | 0              | 0              |

**Scheduler Metrics:**

| Scheduler Type     | Scheduling Resource Type      | Minimum Allocation      | Maximum Allocation      | Maximum Cluster Application Priority |
|--------------------|-------------------------------|-------------------------|-------------------------|--------------------------------------|
| Capacity Scheduler | [memory-mb (unit=Mi), vcores] | <memory:1024, vCores:1> | <memory:8192, vCores:4> | 0                                    |

**Nodes Table:**

| Node Labels   | Rack    | Node State                            | Node Address                         | Node HTTP Address | Last health-update             | Health-report | Containers | Allocation Tags | Mem Used | Mem Avail | VCores Used | VCores Avail | Version |
|---------------|---------|---------------------------------------|--------------------------------------|-------------------|--------------------------------|---------------|------------|-----------------|----------|-----------|-------------|--------------|---------|
| /default-rack | RUNNING | big-data.c.dhbw-254309.internal:38235 | big-data.c.dhbw-254309.internal:8042 |                   | Sat Sep 30 15:32:22 +0000 2023 |               | 0          |                 | 0 B      | 16 GB     | 0           | 8            | 3.1.2   |

Showing 1 to 1 of 1 entries

# Check Hadoop/HDFS

12. Check NameNode Landing and Status Page (<http://XXX.XXX.XXX.XXX:9870>):

The screenshot shows the Hadoop NameNode Overview page for 'localhost:9000' (active). It displays the following information:

**Started:** Sat Oct 12 17:18:25 +0200 2019  
**Version:** 3.1.2, r10190d60bc12e05e48ac71ed8450a58be5d9a  
**Compiled:** Tue Jan 29 02:39:00 +0100 2019 by sunpig from branch-3.1.2  
**Cluster ID:** CID-ebad802c-cccf-4da3-abc4-715b27d64c1  
**Block Pool ID:** BP-540856523-10.156.0.8-15708914429

**Summary**

Security is off.  
Safemode is off.  
1 files and directories, 0 blocks (0 replicated blocks, 0 erasure coded block groups) = 1 total filesystem object(s)  
Heap Memory used 97.07 MB of 520 MB Heap Memory. Max Heap Memory is 3.26 GB.  
Non Heap Memory used 54.47 MB of 55.77 MB Committed Non Heap Memory. Max Non Heap Memory is <unbounded>.

| Configured Capacity:                        | 28.9 GB                                  |
|---|--|
| Configured Remote Capacity:                 | 0 B                                      |
| DFS Used:                                   | 24 KB (0%)                               |
| Non DFS Used:                               | 2.64 GB                                  |
| DFS Remaining:                              | 26.25 GB (99.82%)                        |
| Block Pool Used:                            | 24 KB (0%)                               |
| Datanodes usage(%): (Min/Median/Max/MdDev): | 0.00% / 0.00% / 0.00% / 0.00%            |
| Live Nodes:                                 | 1 (Decommissioned: 0, In Maintenance: 0) |

The screenshot shows the Hadoop Datanode Information page for 'localhost:9000'. It displays the following information:

**Datanode Information**

Datanode usage histogram

Disk usage of each DataNode (%)

In operation

| Node   | Http Address   | Last contact | Last Block Report | Capacity | Blocks | Block pool used | Version |
|--|--|--------------|-------------------|----------|--------|-----------------|---------|
| #log-datanode:drwx254308 internal:9886<br>127.0.1.1:8088 | http://log-datanode:drwx254308 internal:9886<br>127.0.1.1:8088 | 2s           | 8m                | 28.9 GB  | 0      | 24 KB (0%)      | 3.1.2   |

# Check Hadoop/HDFS

13. Check HDFS File Browser (<http://XXX.XXX.XXX.XXX:9870/explorer.html#/>)

The screenshot shows a web browser window displaying the HDFS File Browser at the URL <http://35.235.41.203:9870/explorer.html#/>. The title bar of the browser shows various icons. The main page has a green header bar with the following menu items: Hadoop, Overview, Datanodes, Datanode Volume Failures, Snapshot, Startup Progress, Utilities, and a dropdown menu. Below the header is a search bar with placeholder text "Search:" and a "Go!" button. The main content area is titled "Browse Directory" and shows a table of file system entries. The table has columns: Permission, Owner, Group, Size, Last Modified, Replication, Block Size, and Name. There is one entry listed:

| Permission | Owner  | Group      | Size | Last Modified | Replication | Block Size | Name |
|------------|--------|------------|------|---------------|-------------|------------|------|
| dwxr-xr-x  | hadoop | supergroup | 0 B  | Oct 12 17:29  | 0           | 0 B        | user |

Below the table, it says "Showing 1 to 1 of 1 entries". At the bottom left, there is a small note: "Hadoop, 2018."

# Working with HDFS

## 1. Create User Directory (*on HDFS*):

```
hadoop fs -mkdir /user  
hadoop fs -mkdir /user/hadoop
```

## 2. List Directories (*on HDFS*):

```
hadoop@big-data:~$ hadoop fs -ls /  
Found 1 items  
drwxr-xr-x  - hadoop supergroup          0 2021-09-26 16:36 /user  
hadoop@big-data:~$
```

# Working with HDFS

3. Copy File (just a *random log file*) from local directory to HDFS:

```
hadoop fs -put /var/log/dpkg.log /user/hadoop/dpkg.log
```

# Run Example MapReduce Job

1. Using MapReduce WordCount Jar provided by Hadoop to count words within file `dpkg.log`

```
hadoop jar hadoop/share/hadoop/mapreduce/hadoop-mapreduce-examples-3.1.2.jar  
wordcount /user/hadoop/dpkg.log /user/hadoop/test_output
```

2. View Running MapReduce Job:

The screenshot shows the Hadoop Web UI at the URL [35.235.41.203:8088/cluster](http://35.235.41.203:8088/cluster). The main page is titled "All Applications". On the left, there's a sidebar with navigation links for Cluster, Applications (with a list of states: NEW, NEW\_SAVING, SUBMITTED, ACCEPTED, RUNNING, FINISHED, FAILED, KILLED), Scheduler, and Tools. The main content area has three tabs: Cluster Metrics, Scheduler Metrics, and Application Metrics. Under Application Metrics, the table shows the following data for the running application:

| ID                             | User   | Name       | Application Type | Queue   | Application Priority | StartTime                      | FinishTime | State   | FinalStatus | Running Containers | Allocated CPU VCores | Allocated Memory MB | Reserved CPU VCores | Reserved Memory MB | % of Queue | % of Cluster | Progress | Tracking UI       | Blacklisted Nodes |
|--------------------------------|--------|------------|------------------|---------|----------------------|--------------------------------|------------|---------|-------------|--------------------|----------------------|---------------------|---------------------|--------------------|------------|--------------|----------|-------------------|-------------------|
| application_1570893575375_0001 | hadoop | word count | MAPREDUCE        | default | 0                    | Sat Oct 12 17:47:40 +0200 2019 | N/A        | RUNNING | UNDEFINED   | 1                  | 1                    | 2048                | 0                   | 0                  | 25.0       | 25.0         | 0        | ApplicationMaster | 0                 |

At the bottom of the table, it says "Showing 1 to 1 of 1 entries".

# Run Example MapReduce Job

## 3. Take A Look At The Output/Result (*via Bash*):

```
hadoop@big-data:~$ hadoop fs -cat /user/hadoop/test_output/part-r-00000
...
libglx0:amd64 8
libgraphite2-3:amd64 8
libgtk2.0-0:amd64 8
libgtk2.0-bin:amd64 8

# Exercises I

Hadoop, HDFS, Yarn

# Exercises

## 1. Clone git repo (to get sample data):

```
git clone https://github.com/marcelmittelstaedt/BigData.git
```

2.

- **Copy sample file** (*/BigData/exercises/winter\_semester\_2025-2025/01\_hadoop/sample\_data/Faust\_1.txt*) from Git Repo to HDFS.
- Use and **run default MapReduce Jar** (*hadoop/share/hadoop/mapreduce/hadoop-mapreduce-examples-3.1.2.jar*) to calculate **wordcount** for text file.
- **Copy result** of MapReduce job back to local ubuntu **filesystem**.

3.

- Use and **run default MapReduce Jar** (*hadoop/share/hadoop/mapreduce/hadoop-mapreduce-examples-3.1.2.jar*) to **get the count of occurrences** of the exact string ,**Faust**‘ within text file.
- **Copy result** of MapReduce job back to local ubuntu **filesystem**.
- **Tip:** don't use *wordcount* part of jar but another MapReduce program on next slide.

## MapReduce Examples within *hadoop-mapreduce-examples-3.1.1.jar*:

|                               |   |
|-------------------------------|---|
| <b>aggregatewordcount:</b>    | An Aggregate based mapreduce program that counts the words in the input files.                        |
| <b>aggregatewordhist:</b>     | An Aggregate based mapreduce program that computes the histogram of the words in the input files.     |
| <b>bbp:</b>                   | A mapreduce program that uses Bailey-Borwein-Plouffe to compute exact digits of Pi.                   |
| <b>dbcount:</b>               | An example job that counts the pageview logs stored in a database.                                    |
| <b>distbbp:</b>               | A mapreduce program that uses a BBP-type formula to compute exact bits of Pi.                         |
| <b>grep:</b>                  | A mapreduce program that counts the matches of a regex in the input.                                  |
| <b>join:</b>                  | A job that performs a join over sorted, equally partitioned datasets.                                 |
| <b>multifilewc:</b>           | A job that counts words from several files.   |
| <b>pentomino:</b>             | A mapreduce tile laying program to find solutions to pentomino problems.                              |
| <b>pi:</b>                    | A mapreduce program that estimates Pi using a quasi-Monte Carlo method.                               |
| <b>randomtextwriter:</b>      | A mapreduce program that writes 10 GB of random textual data per node.                                |
| <b>randomwriter:</b>          | A mapreduce program that writes 10 GB of random data per node.  |
| <b>secondarysort:</b>         | An example defining a secondary sort to the reduce phase.   |
| <b>sort:</b>                  | A mapreduce program that sorts the data written by the random writer.                                 |
| <b>sudoku:</b>                | A sudoku solver.  |
| <b>teragen:</b>               | Generate data for the terasort.   |
| <b>terasort:</b>              | Run the terasort.   |
| <b>teravalidate:</b>          | Checking results of terasort.   |
| <b>wordcount:</b>             | A mapreduce program that counts the words in the input files.   |
| <b>wordmean:</b>              | A mapreduce program that counts the average length of the words in the input files.                   |
| <b>wordmedian:</b>            | A mapreduce program that counts the median length of the words in the input files.                    |
| <b>wordstandarddeviation:</b> | A mapreduce program that counts the standard deviation of the length of the words in the input files. |
